#### TRANSMITTAL OF PRIORITY DOCUMENT UNDER 35 USC §119

Applicant hereby confirms his claim of priority under 35 USC §119 from the following application(s):

·European Patent Convention Application No. 03004489.5 filed February 28, 2003

·European Patent Convention Application No. 03012120.6 filed May 30, 2003

A certified copy of each application from which priority is claimed is submitted herewith.

Please apply any charges or credits to Deposit Account No. 06-1050.

#### CERTIFICATE OF MAILING BY FIRST CLASS MAIL

I hereby certify under 37 CFR §1.8(a) that this correspondence is being deposited with the United States Postal Service as first class mail with sufficient postage on the date indicated below and is addressed to the Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

-1-

#### PROCESSING DEVELOPMENT OBJECT INTO RUNTIME OBJECT

#### Field of the Invention

The present invention generally relates to data processing and, more particularly, relates to computer systems, computer programs, and methods to provide a runtime object with computer code to control business applications.

#### 02 Background of the Invention

- Software manufacturers design business and enterprise applications at design time, business organizations ("customers") use the business applications at run time.
- Software manufacturers concentrate on the business requirements of their customers and provide applications that are customized for various platforms and requirements.
- The applications are implemented with application specific code (hereinafter "code") in computer languages such as C++, Java or Visual Basic for Applications (VBA). Using object-oriented languages is convenient so that development objects are processed to runtime objects.
- One manufacturer usually serves multiple customers. The runtime objects need to be adapted to the particular needs of a particular customer.

  Therefore, the manufacturer provides an interpreter in combination with a plurality of templates. The customer uses the interpreter to provide the development objects by interpreting the templates in view of customer-specific data.
- The applications are implemented on specific runtime platforms, or frameworks. Different platforms may require runtime objects in different languages to adapt to different operating systems.

- 2 -

- There are several disadvantages of the prior art. The interpreter is complex and specifically adapted to the runtime framework. The manufacturer needs to send the code template and the interpreter to the customer.
- Type consistency between development objects needs consideration, especially when a development object or the template is modified.

  Accidental and intentional (even malicious) changes to the templates (especially at the customer site) could lead to inconsistencies in the code.
- There is an ongoing need to provide improved method, systems, an computer programs to provide runtime objects (source code).

#### 011 Summary of the Invention

- According to the present Invention, a method for use in a computer relates to processing a development object (DO) into a runtime object. The method comprises transforming a development object (DO) into an intermediate object (IO), building an abstract syntax tree (AST) from the intermediate object by using a template, and generating the runtime object from the abstract syntax tree while preserving the structure of the template.
- It is advantageous that different runtime objects for different runtime frameworks can be provided based one and the same intermediate object (IO). In other words, the intermediate object becomes the standard for deriving runtime objects for different runtime frameworks. Preferably, the intermediate object does not contain specifics of the runtime framework. It is further advantageous that the method can be performed at a single functional entity at a single time point without interference from other functional entities.
- Further, the runtime code being the target is no longer part of the code interpreter. Instead, the code is part of the templates. Mistakes or errors are more difficult to make.

-3-

- The portability between languages is enhanced. Switching between languages with same semantic but different syntax, it is sufficient to change the templates. Changing the runtime code can be accomplished by modifying the templates or the development object.
- The above-mentioned problem is solved by method, system and computer program according to the independent claims; preferred implementations are stated in the dependent claims.

#### 017 Brief Description of the Drawings

018	FIG. 1	illustrates an exemplary computer architecture for
		implementing the present invention, wherein the computers
		are operated according to a developer (DEV) function, a
		processing (PRO) function and a run (RUN) function;
019	FIG. 2	illustrates an overview about development objects and runtime
		objects;
020	FIG. 3	illustrates an exemplary overview about runtime objects that
		can be provided according to the present invention;
021	FIG. 4	illustrates a simplified flow chart diagram of a method of the
		present invention;
022	FIG. 5	illustrates a diagram with software components to implement
		the method of the present invention;
023	FIG. 6	illustrates details for step transforming;
024	FIG. 7	illustrates further details for step transforming by comparing a
		first model of the development object and a second model of
		an intermediate object;
025	FIG. 8	illustrates details for step building;
026	FIG. 9	illustrate details for step building by showing the abstract
		syntax tree as a diagram in UML for an exemplary user
		interface;

-4-

027	FIG. 10	illustrates further details for step building by showing the
		names and properties for each node in the diagram of FIG. 9;
028	FIG. 11	illustrates details for step building by showing the abstract
		syntax tree of FIGS. 9-10 as a file with code segments for
		each class/node;
029	FIG. 12	illustrates a classification of templates and corresponding
		abstract syntax trees, by examples from "application class" to
		"business object class";
030	FIG. 13	illustrates a division of templates into template files by
		example for the "application class" template, with the
		assumption that one template file has one production rule;
031	FIG. 14	illustrates an example template file with an example
	•	production rule "BCDeclaration";
032	FIG. 15	illustrates providing an abstract syntax tree library;
033	FIG. 16	illustrates an example of a generator, with computer
		instructions perform step generating (of the method of FIG. 4)
		from the abstract syntax tree (AST), thereby instantiating the
		AST with data;
034	FIG. 17	illustrates exemplary data, used during step generating;
035	FIG. 18	illustrates an example for an application class file being a
		runtime object, obtained in step generating;
036	FIG. 19	illustrates an example for a generation template, used to
		provide a generator (for step generating, cf. FIG. 16);
037	FIG. 20	illustrates an example of an AST-XML-template (result of
		converting generation template to AST-XML-template by using
		template-to-XML-converter) used for providing the generator;
8 8 0	FIG. 21	illustrates an example of an XSL stylesheet used to provide
		the generator; and
039	FIG. 22	illustrates a simplified diagram of a computer network system
		that can be used to perform the method.

- 5 -

#### 040 Detailed Description

- The following description is presented to enable any person skilled in the art to make and use the invention, and is provided in the context of a particular application and its requirements. Various modifications to the disclosed implementations will be readily apparent to those skilled in the art, and the general principles defined herein may be applied to other implementations and applications without departing from the spirit and scope of the present invention. Thus, the present invention is not intended to be limited to the implementations shown, but is to be accorded the widest scope consistent with the principles and features disclosed herein.
- Whenever possible, the same reference numbers and acronyms will be used throughout the figures to refer to the same or like elements. For convenience, reference lists are provided at the end of the specification.
- An example for processing a development object (DO) into a runtime object will be presented for the user interface part of the application.
- Odda Conveniently, words are given in singular (e.g., development object, runtime object, computer, customer). The word "typical" (and its variations) refers to an implementation invention that is convenient but not mandatory.

  Details for an exemplary computer network system to use the method are explained at the end of the specification.
- o45 The following glossary introduces naming conventions.
- The term "development objects" stands for any definition of the application, such as the behavior definition for user interface (UI) elements

  For example, development objects have the form of flowcharts, models, model diagram.
- The term "runtime object" stands for any set of computer instructions that can be invoked to run on a computer to perform the application or parts of the application (e.g. the user interface).

- 6 -

- The term "element" stands for information components (of a document) such as sections, lists, or paragraphs.
- The term "abstract syntax tree" (AST) stands for any computer-internal representation of a runtime object. The AST can be illustrated by a diagram (i.e. tree with nodes, cf. FIGS. 9-10) and that can be coded, for example, by a plurality of code lines (cf. FIG. 11).
- The term "production rule" stands for a predefined section of text used for providing a code class in the runtime object and corresponds to a node in the abstract syntax tree.
- osi In the figures, rectangles with round corners stand for computer instructions that are processed; rectangles with sharp corners stand for computer instructions that cause processing.
- os2 FIG. 1 illustrates an exemplary computer architecture for implementing the present invention. The figure concentrates on <u>functional and time aspects</u> of the invention.
- For convenience of explanation, computer operation is classified into 3 functions. A typically operation scenario includes that these 3 functions are performed on 3 different computers at 3 different time periods, respectively.
- The <u>functions</u> are developer (DEV) function 1000; processing (PRO) function 2000 (also: "service engineer function" or consultant function), and run-time (RUN) function 3000 (also: "use function"). DEV 1000 is typically affiliated with the manufacturer; PRO 2000 and RUN 3000 are typically affiliated with the customer.
- Typically, each function is performed by a person with a specialized skill set: by a developer (DEV 1000), by a consultant as processing specialist (PRO 2000), and by a user (RUN 3000). This is, however, not limiting, the functions can be performed by more or less persons, even by a single person.

**-** 7 -

- Typical <u>time periods</u> are <u>design time</u> (prior to performing the method), <u>process time</u> (executing method), and <u>run time</u> (using method results). Conveniently, time process follows the TIME arrow from left to right. The arrow does not indicate the length of each period. Usually, the process period is the shortest period.
- DEV 1000 takes care about development object (DO) 105 stored in repository 101, typically at design time. DEV typically 1000 operates application development environment 106. Typically, development objects 105 are object oriented (OO) objects.
- PRO 2000 commands a computer to perform method 401. Typically, processing according to the invention starts when repository 101 and template 151 are coupled to any of transformer (T) 210, builder (B) 221 and generator (G) 241. T, G and R symbolize software components with instructions to perform method steps.
- on the third computer) by using the runtime objects (RO) during run-time.

  Runtime objects 305 (RO) are files in in source code 301. RO 305 are the template-enhanced equivalents of the development objects 105 (DO).
- oso It is an advantage (of the present invention) that if natural persons perform functions 1000, 2000 and 3000, they can use their skill sets for their particular functions without interfering into other functions. For example, the consultant does not need the skills of the developer and of the user.
- Application development environment 106 stands for an environment to customize applications by interacting (read from / write to) with repository 101.
- In view of the time of use (design time), repository 101 is also referred to as design time repository (DTR). Repository 101 stores settings that determine the behavior of an application (e.g., tab-order, popup usage).

065

#### 2003P00111EP

-8-

- Runtime framework 310 stands for a framework to process runtime objects 305 that are specific for the application.
- objects 205. FIG. 2 illustrates an overview about development objects 105 and runtime
- of FIG. 3 illustrates an exemplary overview about runtime objects 305 that can be provided according to the present invention. Objects 305 are objects in source code 301.

- 9 -

- of FIG. 4 illustrates a simplified flow chart diagram of method 401 of the present invention
- Method (401) for use in a computer for processing a development object (DO, 105) into a runtime object (305), the method (400) comprising the following steps: transforming (410) a development object (DO, 105) into an Intermediate object (IO, 215); building (421) an abstract syntax tree (AST, 241) from the intermediate object (215) by using a template (151); and generating (431) the runtime object (205) from the abstract syntax tree (241) while preserving the structure of the template (151).
- Preferably, method 401, wherein the development object (DO, 105) comprises meta-data for an application with information about the business logic of the application.
- oro Preferably, method 401, wherein the development object (DO, 105) has been provided in a visual environment by drag and drop declarations.
- opposition Preferably method 401, wherein the runtime object (305) is an object in source code (301).
- Preferably, method 401, wherein step transforming (410) involves a development object (DO) of a <u>business application</u>. By providing development objects (DO) for the business application, the software manufacturer concentrates on the business requirements of its customer. Providing runtime objects for the particular runtime framework (platform) in use by the customer is done automatically.
- Preferably, method 401, wherein in step building (421), the template (151) uses language elements suitable for files selected from the group of: application class file, application project file, common registry file, machine specific registry file, business component class file, tileset class file, tile

- 10 -

HTML file, and business object class file.

- Preferably, method 401, wherein generating (431) into source code (301) comprises to generate runtime objects in languages selected from the group of Java, Visual Basic for Applications (VBA), Hyper Text Markup Language (HTML).
- Preferably method 401, wherein generating (431) the runtime object comprises to replace placeholders in the abstract syntax tree (241) with data. Elements in the runtime objects (e.g., source code) that are independent from the structure of the development object are completed upon generating the runtime objects. For example, the element "calendar date indicating completion of source code" is introduced by the placeholder "&GenDate&"). Such data is independent from the software manufacturer.
- Preferably, method 401, wherein <u>transforming</u> (410) comprises to receive the development object (105) from a repository (101). The repository is a database that stores development objects and that manages versions of the objects. The repository exists during design time and during transition time. Preferably, the repository is read-only.
- Preferably, method 401, wherein <u>transforming</u> (410) is performed for a <u>plurality</u> of development objects (105).
- Preferably, method 401, wherein <u>transforming</u> (410) the plurality of development objects (105) comprises to preserve the relations between the development objects (105).
- Preferably, method 401, wherein <u>transforming</u> (410) comprises to use development objects (105) based on a first model and to provide Intermediate objects (215) based on a second model, wherein the first

- 11 -

model and the second model have the same meta-model.

OBO Preferably, method 401, wherein transforming (410) comprises to <u>keep</u> the properties and relations in the first model and in the second model.

In other words, the first model that is underlaying the development objects (105) is converted to the second model of intermediate objects (215) (i.e. intermediate object model). The underlaying structures of both models (i.e. their meta-model) remains the same.

081

- OB2 Preferably, method 401, wherein transforming (410) comprises to use development objects (105) based on a first model and to provide intermediate objects (215) based on a second model, wherein the first model and the second model have a different meta-model.
- OB3 Preferably, method 401, wherein transforming (410) comprises to use development objects (105) based on a first model and to provide intermediate objects (215) based on a second model, wherein the metamodel for the first model is a <u>subset of</u> the meta-model of the second model.
- Preferably, method 401, wherein transforming (410) comprises to convert a definition of the first model from a first form in UML (274) to a second form in XML (275) and to add particulars of the second model by XSL (277).
- Preferably, method 401, wherein transforming (410) comprises to convert from the definition in XML to the intermediate objects by using XSLT (276).
- Preferably, method 401, wherein <u>transforming</u> (410) comprises to merge the definition in XML with an XSL stylesheet by an XSLT processor.

- 12 -

- Preferably, method 401, wherein transforming (410) comprises to realign relations between development objects (105).
- Preferably, method 401, wherein in step <u>building</u> (421), the syntax tree (241) is provided in a language that has common elements to the source code language.
- Preferably, method 401, wherein in step building (421), the syntax tree (241) is provided with primary entities (e.g., production rules) in each node of the tree.
- opo Preferably, method 401, wherein in step <u>building</u> (421), the abstract syntax tree (241) is provided using an XSL-engine.
- Preferably, method 401, wherein in step building (421), a template (151) is used that comprises elements selected from the group of: property declarations, initialize statements, methods (the term "method" being used in the context of object oriented programming), event handlers, and layout definitions.
- OP2 Preferably, method 401, wherein in step generating (431), the elements of the templates are converted into elements in the language of the run-time objects (305).
- Preferably, method 401, step <u>building</u> (421) comprises converting a generation template () from a template grammar to an intermediate template () in XML grammar, merging an XSL stylesheet to the abstract syntax tree (241) by an XSLT processor.

097

#### 2003P00111EP

- 13 -

- Preferably, method 401, wherein building (421) an abstract syntax tree (241) comprises to use multiple templates.
- Preferably, method 401, wherein building (421) comprises to use multiple templates that are combined to a template project.
- Preferably, method 401, wherein building (421) comprises to use multiple templates having production rules of different names within the template project.
- ops Preferably, method 401, wherein building (421) comprises to use a template with an include statement.
- Preferably, method 401, wherein building (421) comprises to add instructions to the abstract syntax tree that are adapted to control a computer to perform step generating (431).
- o100 Preferably, method 401, wherein step building (421) comprises using a plurality of combined templates.
- o101 Preferably, method 401, wherein in step building (421), the plurality of templates has names of production rules that are also names of the nodes in the abstract syntax tree.
- o102 Preferably, method 401, wherein in step building, a template (151) is used that has a context free grammar. Such grammars are well know in the classification by Noam Chomski as grammar of type 2.
- o103 Preferably, method 401, wherein step building is performed by processing the template with a stack machine.

- 14 -

- o104 Preferably, method 401, wherein computer instructions to perform step generating are part of the template (151). In other words, instructions to perform generating, in short: "generating code" can be supplied to the computer together with the templates or as part of the templates. This alleviates the operator of the computer (e.g. the consultant) from using specific generating code.
- o105 Preferably, method 401, wherein the computer instructions to perform step generating are in root of the template (151).
- oloo Preferably, method 401, wherein step building (421) is repeated with a further template so that the abstract syntax tree if provided for a different language.
- o107 Preferably, method 401, wherein step transforming (410) and building (421) both comprises using an XSLT processor.
- o108 Preferably, method 401, wherein generating (431) comprises to replace placeholders in the bodies of production rules (i.e. of syntax tree nodes) by actual parameter values.
- o109 Preferably, method 401, wherein generating (431) comprises to receive a parameter value and to replace a placeholder with that parameter value.
- one of the parameter numeral and to replace a placeholder with a predefined value that corresponds to the parameter numeral. (An example is given in connection with "Enum").

- 15 -
- o111 Preferably, method 401, wherein generating (431) comprises to provide one class of source code to one node of the abstract syntax tree.
- o112 Preferably, method 401, wherein the steps building (421) and generating (431) are performed with such definitions (in the template) that the source code (301) that is executed in the runtime framework of a platform selected from the following: personal digital assistant (PDA, handheld device with computer, phone/fax and Internet), wireless application protocol (WAP) phone.
- o113 Preferably, method 401, wherein the steps transforming (410), building (421) and generating (431) are performed for a plurality of development objects substantially simultaneously in a pipeline mode.
- o114 Preferably, method 401, further comprising step storing the abstract syntax tree (241) in a tree library. It is an advantage; reuse of once provided abstract syntax trees.
- o115 Preferably, method 401, further comprising interacting with a processing function to modify any of development object (DO, 105), intermediate object (IO, 215), template (151) and abstract syntax tree.
- o116 Preferably, method 401, is performed by a builder (221), wherein step generating (431) is performed by a generator (231), and wherein the builder (221) and the generator (231) are provided (to the customer) in combination.

- 16 -

- o117 FIG. 5 illustrates a diagram with software components to implement method 401 of the present invention, repository 101 (as input), transformer 210, intermediate objects 215, builder (B) 221, abstract syntax tree (AST) 241, templates 151 (arrow symbol), generator 231, runtime objects (RO 305 in form of source code (SC) 301. Method steps 410, 421, 431 are shown below. Manager 260 coordinates the operation.
- o118 FIG. 6 illustrates details for step transforming: IO-UML-document 274, lo-XML-document 275, IO-XSLT processor 276, IO-XSL-stylesheet 277.
- o120 FIG. 7 illustrates further details for step transforming by comparing a first model of the development object 105 and a second model of an intermediate object 205. By way of simplified example, the development object is designed to for a user interface (UI) element.
- Both models are slightly different. The second model is adapted to the source code language the runtime object (205, to be generated). In the example, the runtime object 205 will be code in VBA (Visual Basic for Business Applications). VBA does not support inheritance. Therefore, the transformation (step 410) maps inheritance (in the first model) to sub- and super-associations (in the second model). This ensures that the properties and relations of the first model are properly transformed to the second model.
- o122 Both models are illustrated by Unified Modeling Language. Symbols like arrows and diamonds are well known in the art. The underscore symbol is introduced in enhance readability.

  Inheritance
- o123 In the first model (upper half of the figure), for example, ARS stands for "Application Repository Services"; AROM stands for "Application Repository Object Model"; Ul\_Interaction\_Comp stands for "Interaction Component, Ul Layer". In the second model (lower half of the figure), IOM stands for

S.24/62

#### 2003P00111EP

- 17 -

"Intermediate Object Model".

- PIG. 8 illustrates details for step building 421 by illustrations of template 241 and builder 221 with AST-class-provider 290, generation template 293,293-n, template-to-XML-converter 294, AST-XML-template 295, AST-XSLT-processor 296, AST-XSL-stylesheet 297, AST-node-class 298.
- o125 FIG. 9 illustrate details for step building by showing the abstract syntax tree as a diagram in UML for an exemplary user interface. The class diagram is given in unified modeling language UML. The rectangles are divided into upper compartments (class name) and lower compartments (class attribute).
- o126 FIG. 10 illustrates further details for step building by showing the names and properties for each node in the diagram of FIG. 9;
- 1000, cf FIG.1) during design time.
- o128 The names of the classes correspond to the names of the classes in the source code (that is generated).
- Node 0 has name "Node" and stands for generate (i.e. performing generating step)
- Node 1 has name "ApplClass" and has attributes that are input parameters "AppName" to indicate the name of the application. "GenVersion" to indicate the version of the application, "GenDate" to indicate the calendar date when the source code is generated (i.e. step building of method 401), "FreeCode" to add design-time model-specific source code sections, and "AppEventHandled" to determine whether the object of a basis class raises events or not (used below in the declaration of the MCore data member).
- o131 Node 2 is a subnode to node 1 and stands for "PopupEnums", a single aggregation implemented as direct reference. Node 5 is a subnode to node 1 and stands for "BCDeclaration" having attributes "ContainerName" and

- 18 -

- "BCName". Details for node 5 is also explained in reference to FIG. 13 (code lines framed). Nodes 4, 5, 6, 7, 8, 9, 10, 11, 14, 15, 16 are multiple aggregations (cf. asterisk symbol) and list variables.
- o132 FIG. 11 illustrates details for step building by showing the abstract syntax tree of FIGS. 9-10 as a file with code segments for each class. It can be used to generate source code in different languages.
- o133 For convenience of explanation, columns within in dashed vertical lines indicate line numbers and node numbers (cf. FIGS. 9-10)
- o134 for convenience of explanation, the figure notes grammar elements with bold italics.
- (corresponding to the nodes). The production rules have placeholders (e.g., indicated by "&" symbols). Generating replaces the placeholders by actual values, depending on input data (i.e. concrete application name replaces the placeholder &AppName&) resulting in source code 301.
- o136 Using <tagname> for the name of a class (e.g., class "ApplClass" for node

  1), start tags and end tags use this name to identify code for the class
- The following convention applies: \$<tagname> for the start tag;

  \$End<tagname> for the end tag; further asterisk \* and plus + signs follow
  the \$ sign; asterisk \* for a number of occurrences between 0 (no
  occurrence) and N; plus + for a number of occurrences between 1 (exactly
  one occurrence) and N.
- o138 Alternatives are indicated by vertical stroke (cf. Backus Naur). For example, the class "EventHandler" for node 11 can result in slightly different code for the parameters. The "EventHandler" has 3 parameters. First parameter ("Signature") and second parameter ("Code") go into source code mandatory; the third parameter goes into the source either as "Normal" or as "MoreThanOneForSameEvent".

- 19 -
- 0139 As an example, node 5 "\$\*BCDeclaration(ContainerName, BCName): Private C&ContainerName& as C&BCName& \$End\$BCDeclaration" is replaced by place holder.
- 0140 FIG. 12 illustrates a classification of templates and corresponding abstract syntax trees, by examples from "application class" to "business object class".
- 0141 FIG. 13 illustrates a division of templates into template files by example for the "application class" template, with the assumption one template file to have one production rule.
- 0142 FIG. 14 illustrates an example template file with an example production rule "BCDeclaration".
- o143 FIG. 15 illustrates providing an abstract syntax tree library.
- o144 FIG. 16 illustrates an example of a generator, with computer instructions perform step generating (of the method of FIG. 4) from the abstract syntax tree (AST), thereby instantiating the AST with data.
- 0145 FIG. 17 illustrates exemplary data, used during step generating.
- 0146 FIG. 18 illustrates an example for an application class file being a runtime object, obtained in step generating.
- 0147 FIG. 19 Illustrates an example for a generation template, used to provide a generator (for step generating, cf. FIG. 16).

- 20 -

- o148 FIG. 20 illustrates an example of an AST-XML-template 295-08 (result of converting 4XX generation template 293-08 to AST-XML-template 295-08 by using template-to-XML-converter 294) used for providing the generator.
- o149 FIG. 21 illustrates an example of an XSL stylesheet used to provide the generator.
- o150 FIG. 22 illustrates a simplified diagram of a computer network system. It illustrates a simplified block diagram of exemplary computer system 999 having a plurality of computers 900, 901, 902 (or even more, cf. FIG. 1 first, second, third computer).
- o151 Computer 900 can communicate with computers 901 and 902 over network 990. Computer 900 has processor 910, memory 920, bus 930, and, optionally, input device 940 and output device 950 (I/O devices, user interface 960). As illustrated, the invention is implemented by computer program product 100 (CPP), carrier 970 and signal 980.
- o152 In respect to computer 900, computer 901/902 is sometimes referred to as "remote computer", computer 901/902 is, for example, a server, a peer device or other common network node, and typically has many or all of the elements described relative to computer 900.
- o153 Computer 900 is, for example, a conventional personal computer (PC), a desktop device or a hand-held device, a multiprocessor computer, a pen computer, a microprocessor-based or programmable consumer electronics device, a minicomputer, a mainframe computer, a personal mobile computing device, a mobile phone, a portable or stationary personal computer, a palmtop computer or the like.
- o154 Processor 910 is, for example, a central processing unit (CPU), a microcontroller unit (MCU), digital signal processor (DSP), or the like.
- o155 Memory 920 is elements that temporarily or permanently store data and instructions. Although memory 920 is illustrated as part of computer 900, memory can also be implemented in network 990, in computers 901/902

- 21 -

and in processor 910 Itself (e.g., cache, register), or elsewhere. Memory 920 can be a read only memory (ROM), a random access memory (RAM), or a memory with other access options. Memory 920 is physically implemented by computer-readable media, for example: (a) magnetic media, like a hard disk, a floppy disk, or other magnetic disk, a tape, a cassette tape; (b) optical media, like optical disk (CD-ROM, digital versatile disk - DVD); (c) semiconductor media, like DRAM, SRAM, EPROM, EEPROM, memory stick.

- o156 Optionally, memory 920 is distributed. Portions of memory 920 can be removable or non-removable. For reading from media and for writing in media, computer 900 uses well-known devices, for example, disk drives, or tape drives.
- o157 Memory 920 stores modules such as, for example, a basic input output system (BIOS), an operating system (OS), a program library, a compiler, an interpreter, and a text- processing tool. Modules are commercially available and can be installed on computer 900. For simplicity, these modules are not illustrated.
- o158 CPP 100 has program instructions and optionally data that cause processor 910 to execute method steps of the present invention. In other words, CPP 100 can control the operation of computer 900 and its interaction in network system 999 so that is operates to perform in accordance with the invention. For example and without the intention to be limiting, CPP 100 can be available as source code in any programming language, and as object code ("binary code") in a compiled form.
- o159 Although CPP 100 is illustrated as being stored in memory 920, CPP 100 can be located elsewhere. CPP 100 can also be embodied in carrier 970.
- o160 Carrier 970 is illustrated outside computer 900. For communicating CPP 100 to computer 900, carrier 970 is conveniently inserted into input device 940. Carrier 970 is implemented as any computer readable medium, such as a medium largely explained above (cf. memory 920). Generally, carrier 970 is an article of manufacture having a computer readable medium with

- 22 -

- computer readable program code to cause the computer to perform methods of the present invention. Further, signal 980 can also embody computer program product 100.
- o161 Having described CPP 100, carrier 970, and signal 980 in connection with computer 900 is convenient. Optionally, further carriers and further signals embody computer program products (CPP) to be executed by further processors in computers 901 and 902.
- Input device 940 provides data and instructions for processing by computer 900. Device 940 can be a keyboard, a pointing device (e.g., mouse, trackball, cursor direction keys), microphone, joystick, game pad, scanner, or disc drive. Although the examples are devices with human interaction, device 940 can also be a device without human interaction, for example, a wireless receiver (e.g., with satellite dish or terrestrial antenna), a sensor (e.g., a thermometer), a counter (e.g., a goods counter in a factory). Input device 940 can serve to read carrier 970.
- Output device 950 presents instructions and data that have been processed. For example, this can be a monitor or a display, (cathode ray tube (CRT), flat panel display, liquid crystal display (LCD), speaker, printer, plotter, vibration alert device. Output device 950 can communicate with the user, but it can also communicate with further computers.
- o164 Input device 940 and output device 950 can be combined to a single device.

  Any device 940 and 950 can be provided optional.
- o165 Bus 930 and network 990 provide logical and physical connections by conveying instruction and data signals. While connections inside computer 900 are conveniently referred to as "bus 930", connections between computers 900-902 are referred to as "network 990". Optionally, network 990 includes gateways which are computers that specialize in data transmission and protocol conversion.
- olee Devices 940 and 950 are coupled to computer 900 by bus 930 (as illustrated) or by network 990 (optional). While the signals inside computer

5.30/62

#### 2003P00111EP

- 23 -

- 900 are mostly electrical signals, the signals in network are electrical, electromagnetic, optical or wireless (radio) signals.
- Networks are commonplace in offices, enterprise-wide computer networks, intranets and the Internet (e.g., world wide web). Network 990 can be a wired or a wireless network. To name a few network implementations, network 990 can be, for example, a local area network (LAN), a wide area network (WAN), a public switched telephone network (PSTN); a Integrated Services Digital Network (ISDN), an infra-red (IR) link, a radio link, like Universal Mobile Telecommunications System (UMTS), Global System for Mobile Communication (GSM), Code Division Multiple Access (CDMA), or satellite link.
- o168 A variety of transmission protocols, data formats and conventions is known, for example, as transmission control protocol/internet protocol (TCP/IP), hypertext transfer protocol (HTTP), secure HTTP, wireless application protocol (WAP), unique resource locator (URL), a unique resource identifier (URI), hypertext markup language (HTML), extensible markup language (XML), extensible hypertext markup language (XHTML), wireless markup language (WML), Standard Generalized Markup Language (SGML).
- one Interfaces coupled between the elements are also well known in the art. For simplicity, interfaces are not illustrated. An interface can be, for example, a serial port interface, a parallel port interface, a game port, a universal serial bus (USB) interface, an internal or external modem, a video adapter, or a sound card.
- computer and program are closely related. As used, phrases, such as "the computer provides" and "the program provides", are convenient abbreviation to express actions by a computer that is controlled by a program.
- o171 The present invention can also be considered as a process for providing computer source code (301) to a customer, wherein the process has a first sub-process performed by at least one manufacturer (at development time)

- 24 -

and a second sub-process performed by the customer (at process time), wherein the sub-processes comprises step as follows: the first sub-process, providing a template (151) and a builder (221), transferring the template (151) and the builder (221) to the customer (C); in the second sub-process, providing a repository (101) with development objects (105) that implements customer specific data, performing method, thereby providing source code (that implements customer specific data).

- 0172 The source code (301) is subsequently compiled to an application.
- Further, a method for providing source code (301) (i.e. runtime code) for subsequent execution in a runtime framework (310), the method (400) comprising the following steps: providing first code that enables a computer to transform (410) a development object (105) into an intermediate object model (215); providing second code that enables the computer to build (421) an abstract syntax tree (241) from the intermediate object model (215) by using a template; and providing third code that enables the computer to generate (431) the source code from the abstract syntax tree (241) by linking the abstract syntax tree (241) while preserving the structure of the template.

#### Claims

- Method (401) for use in a computer for processing a development object 1. (DO, 105) into a runtime object (305), the method (400) comprising the following steps:
  - transforming (410) a development object (DO, 105) into an intermediate object (IO, 215);
  - building (421) an abstract syntax tree (AST, 241) from the intermediate object (215) by using a template (151); and
  - generating (431) the runtime object (205) from the abstract syntax tree (241) while preserving the structure of the template (151).
- The method (401) of claim 1, wherein the development object (DO, 105) 2. comprises meta-data for an application with information about the business logic of the application.
- The method (401) of claim 1, wherein the development object (DO, 105) 3. has been provided in a visual environment by drag and drop declarations.
- The method (401) of claim 1, wherein the runtime object (305) is an object 4. in source code (301).
- 5. The method (401) of claim 1, wherein step transforming (410) involves a development object (DO) of a business application.
- 6. The method (401) of claim 1, wherein in step building (421), the template (151) uses language elements suitable for files selected from the group of: application class file, application project file, common registry file, machine specific registry file, business component class file, tileset class file, tile HTML file, and business object class file.

- 28 -

- 7. The method (401) of claim 1, wherein generating (431) into source code (301) comprises to generate runtime objects in languages selected from the group of Java, Visual Basic for Applications (VBA), Hyper Text Markup Language (HTML).
- 8. The method (401) of claim 1, wherein generating (431) the runtime object comprises to replace placeholders in the abstract syntax tree (241) with data.
- 9. The method (401) of claim 1, wherein transforming (410) comprises to receive the development object (105) from a repository (101).
- 10. The method (401) of claim 1, wherein transforming (410) is performed for a plurality of development objects (105).
- 11. The method (401) of claim 9, wherein transforming (410) the plurality of development objects (105) comprises to preserve the relations between the development objects (105).
- 12. The method (401) of claim 9, wherein transforming (410) comprises to use development objects (105) based on a first model and to provide intermediate objects (215) based on a second model, wherein the first model and the second model have the same meta-model.
- 13. The method (401) of claim 12, wherein transforming (410) comprises to keep the properties and relations in the first model and in the second model.
- 14. A computer program product, which can be loaded into an internal memory of a digital data processing means and has computer program code means, which carry out the method of any of claims 1-13 when they are loaded and run on one or more data processing means

S.36/62

2003P00111EP

- 29 -

15. Computer system for performing the method of any of claims 1-13.
